Abstract

The purpose of this note is to retain five names of small cetaceans—*Delphinapterus leucas* (Pallas, 1776) for the beluga whale, *Tursiops truncatus* (Montagu, 1821) for the common bottlenose dolphin, *Lissodelphis borealis* (Peale, 1849) for the northern right whale dolphin, *Cephalorhynchus eutropia* (Gray, 1846) for the Chilean dolphin, and *Inia geoffrensis* (Blainville in Desmarest, 1817) for the Amazon river dolphin—that are each threatened by synonyms that antedate their currently used names. In each case, the earlier name has rarely or never been used in the past 120 years, and its resurrection as the valid name for these species would threaten stability. Prevailing usage must be maintained to favor stability over priority in accordance with Article 23.9 of the International Code of Zoological Nomenclature. I request that in each case listed, the designated junior synonym be henceforth considered a *nomen protectum* (and thereby continue to be used as the valid name for the relevant taxon) and that each of the indicated senior synonyms be treated as a *nomen oblitum* (i.e., forgotten name).

Key Words: nomenclature, taxonomy, systematics, Cetacea, Odontoceti, dolphin, porpoise, small whale

Introduction

The International Code of Zoological Nomenclature (hereafter referred to as the “Code”) governs the use of scientific names for all animals (ICZN, 1999). It contains very specific rules about which name is to be used for each species. In most cases, the name to be used (i.e., the “valid” name) is the oldest available name published since the start of our current system of binomial nomenclature, which was established by Linnaeus in 1758. But,

in certain cases, generally to maintain stability, the Code allows for the use of a younger name (a junior synonym) to be officially recognized as the valid name of a species. This usually happens when the older name (the senior synonym) falls out of use for one reason or another. An example of this is preservation of the use of *Stenella attenuata* for the pantropical spotted dolphin, despite several names that antedate it (Perrin, 1990; ICZN, 1991). Identifying and resolving such cases are important means of stabilizing the nomenclature and avoiding the large-scale confusion that can happen when the name of a commonly known species is suddenly changed for reasons of what many might consider simple “taxonomic book-keeping.”

In the process of preparing an exhaustive monograph reviewing all nominal species of small cetaceans of the cetacean families Delphinidae, Phocoenidae, Monodontidae, Iniidae, Platanistidae, and Pontoporiidae (Jefferson, in press), I have identified five cases in which there is an unresolved instance of a junior synonym being extensively used as the valid name of a species. In each case, the resurrection of the senior synonym for use as the valid species name would threaten stability and cause great confusion.

The relevant rules of the Code are contained in Article 23.9 (ICZN, 1999, pp. 27-28):

- 23.9. Reversal of precedence. In accordance with the purpose of the Principle of Priority [Art. 23.2], its application is moderated as follows:
 - 23.9.1. Prevailing usage must be maintained when the following conditions are both met:
 - 23.9.1.1. the senior synonym or homonym has not been used as a valid name after 1899, and
 - 23.9.1.2. the junior synonym or homonym has been used for a particular taxon, as its presumed valid name, in at least 25 works, published by at least 10 authors in the immediately

preceding 50 years and encompassing a span of not less than 10 years.

23.9.2. An author who discovers that both the conditions of 23.9.1 are met should cite the two names together and state explicitly that the younger name is valid, and that the action is taken in accordance with this Article; at the same time the author must give evidence that the conditions of Article 23.9.1.2 are met, and also state that, to his or her knowledge, the condition in Article 23.9.1.1 applies. From the date of publication of that act the younger name has precedence over the older name. When cited, the younger but valid name may be qualified by the term *nomen protectum* and the invalid, but older, name by the term *nomen oblitum* (see Glossary). In the case of subjective synonymy, whenever the names are not regarded as synonyms the older name may be used as valid.

Retention of *Delphinapterus leucas* (Pallas, 1776) by Invalidation of *Cetus albicans* Brisson, 1762

The beluga whale is currently known as *Delphinapterus leucas* (Pallas, 1776). However, 14 years before Pallas's name was published, Brisson (1762) gave a short description of a white whale ("le chachalot blanc") found in the Davis Strait and vicinity ("Baye Meridionale, appellee Sud-Bucht") (p. 227). It appears to be the first description and name used for the beluga whale, though that description appears to have been largely forgotten in recent times. Actually, Brisson had earlier described this species in 1756, but that was pre-Linnaean. Brisson's species was supposedly similar to the narwhal and was about 4.6 to 4.9 m in length (15 to 16 feet). No type specimen was collected, but the type locality was Sydbay, Greenland (C. C. Kinze, pers. comm., 27 January 2021). Hershkovitz (1966) also listed the name *B[alaena] albicans* Müller, 1776 for this species but gave priority for the beluga whale to Pallas's *D. leucas*, a practice that has been dutifully, though apparently incorrectly, followed ever since. Interestingly, Tomilin (1957/1967) accurately showed *C. albicans* Brisson to be the senior synonym of the beluga whale but did not explain why this name was not used as the valid name, instead using *D. leucas* (Pallas).

Although *C. albicans* Brisson is the senior synonym, to my knowledge this name has not been used for the beluga whale since before 1899. Instead, *Delphinapterus leucas* (Pallas) has been used universally for this species since then as exemplified by the following 25 works published between 1973 and 2012:

- Brodie, P. F. (1989). The white whale *Delphinapterus leucas* (Pallas, 1776). In S. H. Ridgway & R. Harrison (Eds.), *Handbook of marine mammals: Volume 4. River dolphins and the larger toothed whales* (pp. 119-144). Academic Press.

- Therefore, the conditions of both ICZN Articles 23.9.1.1 and 23.9.1.2 have been met and apply to this species, and the younger name has precedence over the older name. Thus, from the date of publication of the current paper, *C. albicans* Brisson is to be viewed as a *nomen oblitum*; the name *Delphinapterus leucas* (Pallas) is the associated *nomen protectum* and the valid scientific name of the beluga whale. Although Pallas (1776) did not specifically designate a holotype, the specimen described in Table 4 of his book may be considered as a type specimen. Though the exact date of publication is uncertain, if Müller's (1776) *B[alaena] albicans* is found to antedate *Delphinus leucas* Pallas, 1776, then the former name would also need to be suppressed.

Retention of *Tursiops truncatus* (Montagu, 1821) by Invalidation of *Delphinus tursio* Gunnerus, 1768

The common bottlenose dolphin is currently known as *Tursiops truncatus* (Montagu, 1821). An earlier synonym, *Delphinus nesarnack* Lacepede, 1804 has already been declared a *nomen oblitum* by the ICZN (Tubbs, 1986), and the argument made by Rice (1984) in that case also applies to the current situation. Fifty-three years before Montagu's species was published, *Delphinus tursio* was named and described by Gunnerus (1768), with reference to the description and illustrations in Klein (1741), which clearly show a common bottlenose dolphin. The name appears to have been long overlooked and forgotten, but Kinze (2018) recently exhaustively reviewed the relevant history and proposed resurrecting *Delphinus tursio* as the valid name for the common bottlenose dolphin. *Delphinus tursio* Gunnerus is the senior homonym of *D. tursio* Fabricius, 1780, which enjoyed occasional use in the 20th century. However, True (1903) argued that this latter name was not associated with a bottlenose dolphin (but see also Kinze, 2018).

Despite Kinze's (2018) suggestion, a recent vote of the Society for Marine Mammalogy's Taxonomy Committee did not support using *T. tursio* as the valid name of the common bottlenose dolphin (generally citing the problems and confusion that upsetting the stability of this well-known and well-studied species would cause) and, instead, considered it appropriate to have that name declared a *nomen oblitum*.

A recent literature search found only four cases of Gunnerus's *D. tursio* having been used for the bottlenose dolphin since 1899 (Kükenthal, 1909a,

1909b; Burlet, 1917; Brunner, 1918), and these were all anatomical papers, not primarily taxonomic in nature. However, *D. tursio* has been used in a number of papers in the German and Nordic zoological literature through about 1960 (C. C. Kinze, pers. comm., 27 January 2021). Fabricius's *D. tursio* may have been based partly on a white beaked dolphin (*Lagenorhynchus albirostris*), though Bonnaterre's use of the name clearly depicts a bottlenose dolphin (Kinze, 2018). Despite the occasional use of *D. tursio* for the bottlenose dolphin, *T. truncatus* (Montagu) has been used nearly universally for this species for over 120 years as exemplified by the following 25 recent works published between 1980 and 2018:

- Au, W. W. L. (1980). Echolocation signals of the Atlantic bottlenose dolphin (*Tursiops truncatus*) in open waters. In R. G. Busnel & J. F. - Tezanos-Pinto, G., Baker, C. S., Russell, K., Martien, K., Baird, R. W., Hutt, A., Stone, G., Mignucci-Giannoni, A. A., Caballero, S., Endo, T., Lavery, S., Oremus, M., Olavarria, C., & Garrigue, C. (2008). A worldwide perspective on the population structure and genetic diversity of bottlenose dolphins (*Tursiops truncatus*) in New Zealand. *Journal of Heredity*, 100, 11–24. <https://doi.org/10.1093/jhered/esn039>
- Zornetzer, H. R., & Duffield, D. A. (2003). Captive-born bottlenose dolphin × common dolphin (*Tursiops truncatus* × *Delphinus capensis*) intergeneric hybrids. *Canadian Journal of Zoology*, 81, 1755–1762. <https://doi.org/10.1139/z03-150>

Therefore, the conditions of both ICZN Articles 23.9.1.1 and 23.9.1.2 have been met and apply to this species, and the younger name has precedence over the older name. Thus, from the date of publication of the current paper, *D. tursio* Gunnerus is to be viewed as a *nomen oblitum*; the name *Tursiops truncatus* (Montagu) is the associated *nomen protectum* and the valid scientific name of the common bottlenose dolphin. Since *D. tursio* of Fabricius (1780) and of Bonnaterre (1789) are interconnected, these names may also be viewed as *nomina obliterata*.

Retention of *Lissodelphis borealis* (Peale, 1849) by Invalidation of *Lagenorhynchus thicolea* Gray, 1846

The northern right whale dolphin has been known as *Lissodelphis borealis* (Peale, 1849) for many decades (though the date is often erroneously given as 1848, which is based on the printed date on the monograph). Peale (1849) and later Cassin (1858) provided detailed descriptions and illustrations of this species in their accounts, but an earlier name applies to this species. In 1846, Gray (Plate 36) illustrated a dolphin skull and labeled it *Lagenorhynchus thicolea*. There was no description in the text, but a few years later, Gray published a short description of the species based on a single, damaged skull. For many decades after, the specimen was considered to represent a species of *Lagenorhynchus* (e.g., Miller, 1923; Bierman & Slijper, 1948; Miller & Kellogg, 1955; Hershkovitz, 1966; Rice & Scheffer, 1968; Morzer-Brüyns, 1971; Nishiwaki, 1972; Rice, 1977). This was an assumption based on Gray's use of the genus *Lagenorhynchus* for the species and the general similarity of skulls of the two genera. Recently, Vollmer et al. (2019) corrected this and identified Gray's type as a specimen of the genus *Lissodelphis* (right whale dolphins) but considered it to be possibly of either the northern (*L. borealis*) or southern (*L. peronii*) species. However, the stated collection locality of the “west coast of N. America” (confirmed by the author from examination of the tags on the skull in the Natural History Museum, UK) excludes the southern species and, assuming the locality information is correct, thus confirms that this is a specimen of the northern right whale dolphin and, therefore, the senior synonym of that species.

In an extensive search, I could find no use of the name *L. thicolea* Gray as the valid name for the northern right whale dolphin since before 1899. Although this is the senior synonym, to my knowledge, *L. borealis* (Peale) has been used universally for this species since then as exemplified by the following 25 works published between 1970 and 2012:

- Baird, R. W., & Stacey, P. J. (1991). Status of the northern right whale dolphin, *Lissodelphis borealis*, in Canada. *Canadian Field-Naturalist*, 105, 243–250.

- Therefore, the conditions of both ICZN Articles 23.9.1.1 and 23.9.1.2 have been met and apply to this species, and the younger name has precedence over the older name. Thus, from the date of publication of the current paper, *L. thicolea* Gray is to be viewed as a *nomen oblitum*; the name *Lissodelphis borealis* (Peale) is the associated *nomen protectum* and the valid scientific name of the northern right whale dolphin.

Retention of *Cephalorhynchus eutropia* (Gray, 1846) by Invalidation of *Delphinus lunatus* Lesson, 1826

Delphinus lunatus Lesson, 1826 is apparently the earliest name used for the Chilean dolphin, which is currently known as *Cephalorhynchus eutropia* (based on *Delphinus eutropia* Gray, 1846; see Goodall et al. [1988] for a review of the taxonomic history of this species). Lesson's new species was based on a sighting at sea in Bahia de Concepcion, Chile. The original description is brief and rather generic, and no type specimen is in existence. A year later, Lesson & Garnot (1827) redescribed the species, again indicating a brown crescent behind the blowhole. The atlas for that expedition report includes a plate showing the perceived external appearance of this species (Plate 4, Figure 4, which is reproduced in Goodall et al., 1988). It does not much resemble a Chilean dolphin nor any other known species of dolphin. However, the dark crescent is clearly shown, and Goodall et al. (1988) interpreted this diagnostic feature as indicating it to be recognizable as a Chilean dolphin, and I agree. Goodall et al. stated that the name should be considered a *nomen oblitum* but did not present the explicit evidence required by the current version of the Code.

Although *D. lunatus* Lesson is the senior synonym, an extensive search found no examples of the use of *D. lunatus* Lesson since at least 1858. Instead, *C. eutropia* (Gray) has been used universally for this species since then as shown by the following 25 works published between 1975 and 2016:

- Brownell, R. L., Jr., & Mead, J. G. (1989). Taxonomic status of the delphinid (Mammalia: Cetacea) *Tursio? panope* Philippi, 1895. *Proceedings of the Biological Society of Washington*, 102, 532-534.

Therefore, the conditions of both ICZN Articles 23.9.1.1 and 23.9.1.2 have been met and apply to this species, and the younger name has precedence over the older name. Thus, from the date of publication of the current paper, *D. lunatus* Lesson is to be viewed as a *nomen oblitum*; the name *Cephalorhynchus eutropis* (Gray) is the associated *nomen protectum* and the valid scientific name of the Chilean dolphin.

Retention of *Inia geoffrensis* (Blainville in Desmarest, 1817) by Invalidation of *Delphinus rostratus* Shaw, 1801

Recently, Smeenk (2018) showed that *Delphinus rostratus* Shaw, 1801 is the earliest name used for the Amazon river dolphin, or boto, currently known as *Inia geoffrensis* (Blainville in Desmarest, 1817). George Shaw described *Delphinus rostratus* in 1801, based on a type that may have been in the Hunterian Museum (Eschricht, 1851, 1852), which has also been referred to as the Museum of the Royal College of Surgeons. The type was thought to possibly be housed in the Natural History Museum in the United Kingdom, but it could not be located on a visit there by the author in December 2019. The exact type locality is unknown, but the species was "supposed to inhabit the Indian Seas" (Shaw, 1801, p. 514). The name has in the past been considered to be a synonym of *S. bredanensis* or *P. gangetica*, or even as a *nomen dubium*. However, Smeenk (2018), in a detailed and exhaustive historical review of the name *D. rostratus* Shaw, recently demonstrated that the type is almost certainly an example of the Amazon river dolphin (*Inia geoffrensis*). As such, this is technically the senior synonym and should be used as the name for the Amazon river dolphin. Smeenk suggested that it may be appropriate to suppress the name and thereby to conserve *geoffrensis* and consider *D. rostratus* Shaw a *nomen oblitum*. Smeenk may have intended to follow through on this, but, unfortunately, he passed away in 2017.

Although *D. rostratus* Shaw is the senior synonym, to my knowledge there is no evidence that Shaw's name has been in use since 1899. Instead, *I. geoffrensis* (Blainville in Desmarest) has been used universally for this species since then as exemplified by the following 25 works published between 1970 and 2012:

- Aliaga-Rosset, E. (2002). Distribution and abundance of the river dolphin (*Inia geoffrensis*) in the Tijamuchi River, Beni, Bolivia. *Aquatic Mammals*, 28(3), 312-323.

Distribution and abundance of the Amazon river dolphin (*Inia geoffrensis*) and the tucuxi (*Sotalia fluviatilis*) in the upper Amazon River. *Marine Mammal Science*, 13, 427-445. <https://doi.org/10.1111/j.1748-7692.1997.tb00650.x>
- Therefore, the conditions of both ICZN Articles 23.9.1.1 and 23.9.1.2 have been met and apply to this species, and the younger name has precedence over the older name. Thus, from the date of publication of the current paper, *D. rostratus* Shaw is to be viewed as a *nomen oblitum*; the name *Inia geoffrensis* (Blainville in Desmarest) is the associated *nomen protectum* and the valid scientific name of the Amazon river dolphin.

Acknowledgments

I am grateful to C. C. Kinze, R. L. Brownell, Jr., and the late C. Smeenk for discussions relevant to these cases and for providing access to information and difficult-to-find references. I also appreciate the comments of two anonymous reviewers.
